Mol. Biol. 283:231-244(1998)"; FUNCTION: Preferentially cleaves single-stranded RNA at pyrimidine -: FUNCTION: Preferentially cleaves
                                                                                                                                                                                residues with a 3'flanking guanne. Hydrolyzes poly(0) and poly(0) as substrates, and prefers the former. The S-lectins in frog eggs may be involved in the fertilization and development of the frog embryo. This lectin aggluthates various animal cells, including hormal lymphocytes, erythrocytes, and fibroblasts of animal and buman origin. It is cytotoxic against several tumor cells.

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside phosphates and 3'-phosphooligonucleotides ending in C-P or with 2',3'-oyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.

The Triang Selection of the tumor-growth promoter angiogenin in primate evolution.";

Mol. Biol. Evol. 19:438-445(2002).

L. FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs (BP similarity).

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside phosphate and 3'-phosphotoligonucleotides ending in C-P or with 2'.3'-cyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family. PRSSP. P00656; 1SRN.
InterPro; IPRO01427; RNaseA.

"Diversifying selection of the tumor-growth promoter angiogenin in primate evolution.";

"Diversifying selection of the tumor-growth promoter angiogenin in primate evolution.";

"Old Biol. Bvol. 19:438-445(2002).

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endochtal invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs (By similarity).

-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,
Mammalia, Eutheria, Primates, Catarrhini, Cercopithecidae,
                           CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside phosphates and 3'-phosphooligonucleotides ending in C-P or with 2',3'-cyclic phosphate intermediates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        28;
                                                                                                        -!- SUBCELLUTAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Pancreas.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SIMILARITY: Belongs to the pancreatic ribonuclease family.

Isolation, properties, primary structure and glycosidation.";

Eur. J. Biochem. 75:19-100(1977).

-1- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-phosphates and 3'-phosphooligonucleotides ending in C-P or U-P with 2',3'-cyclic phosphate intermediates.
-1- SIBCIELIULAR LOCATION: Secreted.
-1- TISSUE SPECIFICITY: Pancreas.
-1- SIMILARITY: Balongs to the pancreatic ribonuclease family.
-1- HSSP; P00656: ISBN.

                                                                                                                Flochim. Biophys. Acta 1162:177-186 (1993).

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and hydrolyzing cellular Endox.

-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

for e.g. New recombinant ribonucleases, used for killing target cells, treating cancers, viral infections or autoimmune diseases.

Claim 34; Page 60; 71pp; English.

The present sequence is a recombinant Rana pipiens ribonuclease (RaPLR1) protein with Gln1Ser. Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant Met(-1) Rana pipiens ribonuclease Gln1Ser; RaPLR1; CD22; covalently bound; LL2 antibody; ligand binding moiety; cancerous B cell; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein; cancer; frog;
ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be tused in-frame with ligand binding moieties to form cytocoxic fusion proteins. They can be used for treatment of cancer and autoimmune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is Rana pipiens liver ribonuclease (RaPLR1) protein. Carboxy terminal end of RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD2 on cancerous B cells or human chorionic gonadorrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytocoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases
                                                                                                                                                                                                                                                      61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rana pipiens liver ribonuclease, RaPLR1; covalently bound; LL2 antibody; ligand binding moiety; CD22; cancerous B cell; Kaposi's Sarcoma; frog; human chorionic gonadotrophin; hCG; recombinant ribonuclease; RNase; signal peptide; cytotoxic fusion protein; cancer; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  recombinant ribonucleases, used for killing target cells, e.g. for ating cancers, viral infections or autoimmune diseases.

The present sequence is a recombinant Rana pipiens ribonuclease (RaPLR1) protein with Met at position 1. Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding motety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadocrophin (hCd) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune

It is encoded by Clone Salb cDNA obtained from Rana pipiens liver mRNA library. It exhibites differences with Oncomase (RTM) at amino acid credides 11, 20, 85 and 103. Carboxy terminal end of RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (GCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proceins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune

Recombinant Rana pipiens ribonuclease; RaPLR1 Met23Leu; covalently bound; LL2 antibody; ligand binding moiety; CD22; cancerous B cell; RNase; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein; cancer; frog;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a recombinant Rana pipiens ribonuclease (RaPLR1) protein with Met23Leu. Carboxy terminal end of recombinant RaPLR1 has a covalently bound aligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion preteins. They can be used for treatment of cancer and autoimmune

```
The present sequence is a recombinant Rana pipiens ribonuclease protein (RaPLR1) with Met at position 1 attached to (His)6 tag and Met241eu. Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding molety, which can be a LL2 antibody directed against CD2 on against Kaposi's sarcoma cells. Recombinant ribonucleases can be against Kaposi's sarcoma cells. Recombinant ribonucleases can be presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with used for treatment of cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                           note= "(His)6 histidine tag attached to N-terminal Met"

```
AAW35115 to AAW35123 encode recombinant proteins (rOnc) which are modifications of the RNase Onconase (RTM) (nOnc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablantion by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to nonc and also lower
                                                                                                                                                                                                                                                                                                                                                                   Ribonuclease molecules based on native Onconase - used for killing cells, particularly tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 SDWLTFQXKHLTNTRDVDCNN1MSTNLFHCKDKNTF1YSRPEPVKAICKGIIASKNVLTT 60

This is one of two preferred proteins (the other in AAW06543) that have been isolated from Rana pipiens occytes. Both proteins have a blocked amino terminal group and are essentially free of carbohydrates. The proteins are used to treat tumours. Use of the peptides has fewer disadvantages than chemotherapy, radiotherapy and surgery in the treatment of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2 DWLIFQXKHLINIRDVDCNNIMSINLFHCKDXNIFIYSRPEPVKAICKGIIASKNVLITS 61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAW35125 to AAW35135 represent recombinant fusion proteins (ronc) which are modifications of the RNase Onconase (RTM) (nonc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoine grare wablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to none and also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                               Ribonuclease molecules based on native Onconase - used for killing cells, particularly tumour cells.

Sequences AAW35125 to AAW35135 represent recombinant fusion proteins (rOnc) which are modifications of the RNase Onconase (RTM) (nOnc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins ribonucleases have increased cytotoxic activity compared to none also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;

```

ribonucleases have increased cytotoxic activity compared to nonc and also

lower immunogenicity in humans

```
novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to nonc and also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       09

Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to nonc and also
                                                                                         0

(ronc) which are modifications of the RNase Onconase (RTM) (fonc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjudates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation fitto a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new

Ribonuclease molecules based on native Onconase - used for killing cells,

```
The protein is derived from fertilised frogg eggs. It has an iso-electric point of 9.5 - 10.5, a blocked N-terminal gp. and is free of carbohydrates. It is active against certain cancer cells. The combination butene) of the protein and (z-1-p-dimethylaminoethoxyphenyl-1, z-diphenyl-1-separate entities against human pancreatic ASPC-1 adenocarcinoma, and the combination of protein and (10-[3-(4-methyl piperazin-1-yl)-propyl]-2-separate entities against human pancreatic ASPC-1 adenocarcinoma, and the trifluoromethylphenothiazine (Stelazine) is much more reactive than the been shown against human lung A-549 carcinoma. Activity has also been shown against human sub- maxilliary epidermoid carcinoma A-253 HL-60 cells, human colo 320 DM carcinoma IOX melanoma and human lung adumnent colo 320 DM carcinoma LOX melanoma and human lung squamous car- cinoma HT-520 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New protein from fertilised eggs of Rana pipiens - active against cancer cells, esp. in combination with Tamoxifen or Stelazine (trifluoro-perazine).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         95.5%; Score 551; DB 2; Length 104; 96.1%; Pred.
